

LoFi Prototype:

I created a rough drawing of the cart page thinking of the different elements that would be needed. I decided to keep the “Checkout” button right at the top and very obvious so that users would be nudged to actually purchase items and not just add them to their cart. I also decided to add in a heart icon on the products listed so that if a user liked a specific item but did not want to buy it now, they could buy it later on.

Hi-Fi Prototype:

I decided to incorporate all the products inside different boxes to clearly show to the user how many items they had in their cart without having to scan too much. I chose to do this because it will make reviewing the cart much easier than listing all the products with their details in a single box. I also decided to have images next to each selected item so that even without reading the product names, the user could recognize if they had chosen the correct items. Finally, I decided to add the "You may also like" section at the end since in this case the user can also add more items to their cart before deciding to checkout. Having more items right on the page will encourage users to buy more things and thus increase profits for Bun Bun Bakeshop.
